

Creating an Advocacy Page Using Replit AI

Raffi O. Molero
B.S. Computer Science 2-A
21st Century IT Skills

Prompt Refinement

I first used ChatGPT to help build my initial prompt, with the focus on creating some baseline content for an **Advocacy Page** about **Neurodivergence** (later about mental health in general), of course to be built in Replit.

After pasting part of the Laboratory instructions in and discussing the limits of a new Replit free trial, ChatGPT came up with a 3-step process for iteratively creating the website: An initial prompt laying out the purpose and structure of the website, with content included.

First Prompt

Create a one-page responsive website using HTML and CSS about reducing stigma around neurodivergent people, including ADHD.

Use the following content for each section:

Hero Section

Different Minds, Not Broken Minds

Understanding neurodivergence starts with changing how we talk about it.

What is Neurodivergence

Neurodivergence refers to natural differences in how people think, learn, and process information. This includes conditions such as ADHD, autism, and dyslexia. These differences are not flaws—they are variations of the human brain.

Common Misconceptions

Many neurodivergent people are unfairly labeled as “lazy,” “unfocused,” or “difficult.” In reality, these labels ignore how their brains function differently. ADHD, for example, affects attention regulation—not intelligence or effort.

Why It Matters

Stigma can prevent people from seeking help, expressing themselves, or being understood. It can lead to shame, anxiety, and missed opportunities. Creating awareness helps build more inclusive schools, workplaces, and communities.

What You Can Do

Listen without judgment

Avoid using conditions as jokes

Learn more about neurodiversity

Be flexible and understanding

Small changes in attitude can make a big difference.

Requirements:

Use semantic HTML

Include a navigation bar

Use a clean blue/green color scheme

Ensure good spacing and readability

Keep the design modern and simple

First Output

SETTING THE RECORD STRAIGHT

Common Misconceptions

MYTH "Lazy"**REALITY**

Neurodivergent people often expend enormous energy managing tasks that neurotypical people find effortless.

MYTH "Unfocused"**REALITY**

ADHD, for example, affects attention regulation—not intelligence or effort. Hyperfocus is also a common trait.

MYTH "Difficult"**REALITY**

Behavioral differences are often adaptive responses, not defiance. Context and environment matter enormously.

MYTH "Not trying hard enough"**REALITY**

These labels ignore how neurodivergent brains function differently. Effort alone doesn't override neurological wiring.

**Shame & anxiety**

Stigma can lead to internalized shame, heightened anxiety, and avoidance of help.

**Schools & workplaces**

THE IMPACT OF STIGMA

Why It Matters

Made with Replit

**Shame & anxiety**

Stigma can lead to internalized shame, heightened anxiety, and avoidance of help.

**Schools & workplaces**

Awareness builds more inclusive environments where everyone can thrive.

**Seeking help**

Stigma prevents people from reaching out and getting the support they need.

THE IMPACT OF STIGMA

Why It Matters

Stigma can prevent people from seeking help, expressing themselves, or being understood. It can lead to shame, anxiety, and missed opportunities. Creating awareness helps build more inclusive schools, workplaces, and communities.

TAKING ACTION

What You Can Do

Small changes in attitude can make a big difference.

**Listen without judgment**

Give space and validation without jumping to conclusions.

**Avoid using conditions as jokes**

Language shapes perception — casual stigma causes real harm.

Made with Replit

support they need.

TAKING ACTION

What You Can Do

Small changes in attitude can make a big difference.

Listen without judgment

Give space and validation without jumping to conclusions.

Avoid using conditions as jokes

Language shapes perception — casual stigma causes real harm.

Learn more about neurodiversity

Informed understanding replaces harmful assumptions.

Be flexible and understanding

One-size-fits-all approaches often leave neurodivergent people behind.

[Preview: Neurodivergence Awareness](#)

Different Minds, Not Broken Minds

Raising awareness about neurodivergence and reducing stigma, one conversation at a time.

Made with Replit

First Evaluation

Ok so the website looks decent, if a little generic, but I'm not a front-end developer so I don't actually know how to judge these things. Emojis feel a bit off, but I can ignore that for now. The most important thing here is I don't exactly like the tone of the content that I initially gave. It's too defensive and practically only serves to validate neurodivergent people. That doesn't serve as an advocacy. It doesn't reach the people I care about. My next iteration will be about tone and framing.

I realized that this is a topic I genuinely care about. Now, I actually want to advocate for this at least somewhat properly, so I'm actually going to tryhard this assignment now. I had a discussion with ChatGPT regarding my target audiences, the tone I wanted to set, and the way to approach this kind of advocacy.

I came up with these target audiences:

- People unfamiliar with neurodivergence
- Casual users of related terms in everyday language
- Educators and parents with limited prior knowledge

More importantly, I really had to change the tone:

- Reflective instead of corrective
- Conversational instead of academic
- Non-confrontational instead of argumentative
- Emphasis on recognition of real-life situations rather than directly challenging misconceptions

As usual, ChatGPT reeeally likes emojis. Prompt 2 ended up being a whole multi-page prompt. I only did a surface-level skim reading of it to check correctness and content. Just for completeness' sake, here it is, though you may ignore it and skip to the output:

Second Prompt

Restructure and rewrite the "Common Misconceptions" and "What You Can Do" sections of the website. The goal is to shift the tone from explanatory/defensive to reflective, conversational, and easy to understand. The reader should feel like they are remembering real-life situations, not being corrected.

General writing style requirements:

- Use simple, everyday language (no academic or clinical tone)
- Avoid confrontational language (do NOT use "myth vs reality" or "you are wrong" framing)
- Do not sound defensive or argumentative
- Focus on gentle explanation and reflection
- Make the reader feel like they are recalling familiar real-life moments

Use phrases like:

- "You might have seen or heard..."
- "You may remember a time when..."

- “Sometimes people say...”
 - “Think about a moment when...”
 - “In everyday moments like these...”
-

SECTION 1: Rename and restructure “Common Misconceptions”

Rename this section to something more reflective, such as:

- “In Everyday Moments”
 - “Next Time You Notice Something Like This”
 - “In Situations You Might Recognize”
-

Rewrite the content using a reflective, memory-based style. Do NOT use “MYTH / REALITY” formatting.

Include these example ideas (adapt into paragraphs, not bullet rebuttals):

- You might have heard someone say they are “so ADHD” when they are distracted or struggling to focus.
- You might have heard someone say they are “so OCD” when they like things organized or neat.
- You might have heard someone say they are “depressed” when they feel sad for a short time.
- You might have heard someone describe something as “traumatic” when it was stressful or upsetting.

Then gently explain that:

- These phrases are usually used casually in everyday conversation
- However, the actual conditions they refer to are more complex and long-term
- Understanding this helps avoid misunderstandings without blaming anyone for how they speak

Include reflective prompts such as:

- “You might remember a time in school when someone struggled to focus even when they were trying hard...”
- “Or a moment when someone was labeled ‘lazy’ or ‘too distracted’...”
- “Or someone who was very sensitive to order or routine...”

Briefly clarify (in simple language):

- ADHD involves differences in attention regulation, not laziness
 - OCD involves intrusive thoughts and compulsive behaviors, not just preference for order
 - Neurodivergent experiences vary widely between people
-

SECTION 2: Rewrite “What You Can Do”

Rename this section to something more reflective, such as:

- “In Everyday Moments”
 - “Small Shifts in Understanding”
 - “When Understanding Shows Up in Daily Life”
-

Rewrite this section so it feels like gentle reflection, not instructions.

Avoid list-like “rules.” Instead, use short paragraphs or soft bullet points that feel like suggestions.

Include ideas such as:

- You might remember a time when someone was struggling, and a small moment of patience helped more than advice
- In conversations, pausing before labeling someone can change how you understand them
- Sometimes words used casually can shape how we see others without realizing it
- Different people experience attention, stress, and emotion in different ways
- Small adjustments in understanding or flexibility can make everyday environments more inclusive

The tone should feel like:

- “Here are things you might notice in everyday life”
rather than
 - “Here are things you must do”
-

Overall goal of the page:

The reader should feel:

- “I’ve seen something like this before”
- “I never thought about it that way”
- “This makes more sense now”

Keep everything concise, readable, and suitable for a general audience including parents, educators, and people unfamiliar with neurodivergence.

Second Output

- “Common Misconceptions” was replaced with “In Everyday Moments”

[Different Minds](#)[What Is Neurodivergence](#)[Situations You Might Recognize](#)[Why It Matters](#)[Small Shifts in Understanding](#)

In Everyday Moments

Sometimes the words we use in everyday conversation can quietly shape the way we understand each other — without us even realizing it.

You might have heard someone say “*I’m so ADHD today*” when they were feeling distracted, or “*I’m so OCD*” when they wanted things to be neat and organized.

These phrases come up all the time in everyday conversation — and they’re usually not said to cause harm. But the actual conditions they refer to are much more complex and long-lasting than a passing mood or preference. Understanding the difference can help us speak and listen with a little more care.

You might remember a moment in school — or at work — when someone was struggling to focus, even though they were clearly trying hard. Maybe they were labeled “lazy” or “too distracted.” Maybe the expectation was simply that they should try harder.

ADHD affects how the brain regulates attention. It isn’t a reflection of effort or intelligence — it’s a difference in how the brain works. Recognizing that can change how we respond to people in those moments.

Or perhaps you’ve known someone who seemed very sensitive to routine, or who found certain sounds or textures genuinely overwhelming — in ways that were hard to explain. These kinds of experiences are common in neurodivergent people, and they vary widely from person to person.

In everyday moments like these, understanding a little more about how different minds work — without judgment — can go a long way.

Made with Replit

- “What You Can Do” was replaced with “When Understanding Shows Up in Daily Life”

[Different Minds](#)[What Is Neurodivergence](#)[Situations You Might Recognize](#)[Why It Matters](#)[Small Shifts in Understanding](#)

SMALL SHIFTS IN UNDERSTANDING

When Understanding Shows Up in Daily Life

These aren’t rules — they’re things you might notice or remember. Small shifts in how we see each other can quietly make everyday life feel a little more inclusive for everyone.

A moment of patience can matter more than advice

You might remember a time when someone was struggling, and what helped most wasn’t a solution — it was simply being given a little more time, or not being rushed. For many neurodivergent people, patience in small moments makes a real difference.

Pausing before labeling someone can change how you understand them

In conversations, when someone seems “difficult” or “distracted,” there’s often more going on beneath the surface. Pausing to wonder why — rather than jumping to a label — tends to lead to a much clearer picture of what that person actually needs.

Words used casually can quietly shape how we see others

Sometimes phrases like “she’s so OCD” or “he’s being so ADHD” slip into everyday speech without a second thought. It’s worth noticing how those words land — not to feel guilty, but because the way we describe people shapes how we think about them.

Different people experience attention, stress, and emotion differently

Think about a moment when you were overwhelmed or unfocused, and how you would have wanted to be treated. Neurodivergent people often experience those states more intensely, and more often. Small adjustments in flexibility — in how we structure environments, conversations, and expectations — can make everyday life feel genuinely more welcoming.

Made with Replit

Second Evaluation

Alright, looking good. Though I think I focused a bit too hard on those 2 specific sections. The rest of the site could use the same tonal shift.

Speaking of tonal shift, here I realized I wasn't just talking about neurodivergence anymore. I decided to reframe the scope of my advocacy: Understanding beyond impressions. I wanted to push for that, so I went and refined the next prompt again with ChatGPT:

Third Prompt

First, update the overall scope and framing of the website. The site is not only about neurodivergence awareness, but about understanding how people interpret behavior, experiences, and mental states beyond surface-level assumptions. Neurodivergence, mental health conditions, and commonly used labels are all used as examples within this broader theme of perception and understanding.

🧠 NEW GLOBAL THEME (must be reflected in title and hero section):

Replace or refine the main title/hero section, as well as any other text on the site, to reflect this updated scope. It should feel similar in tone and structure to the current title and caption.

BUT it must be adapted to match the new broader focus:

perception and understanding of people beyond surface-level interpretation
not only neurodivergence-specific framing

The tone should remain simple, calm, and reflective.

🧠 Global tone requirements (apply throughout the site):

Use simple, conversational language

Avoid academic, clinical, or essay-like explanations

Avoid confrontational or corrective tone

Use reflective framing ("you might notice / you might have seen / in everyday moments")

Focus on understanding people beyond surface-level impressions

🌿 SECTION 1: "What Is Neurodivergence" (REFINE)

Ensure this section is now clearly positioned as ONE part of a broader understanding framework, not the central focus of the page.

Maintain the three grouped categories:

Neurodivergence (e.g. ADHD, Autism, Dyslexia, Dyspraxia, Dyscalculia, Tourette Syndrome)

Related mental health conditions (e.g. OCD, Anxiety disorders, Depression, PTSD)

Commonly confused everyday traits (e.g. Introversion, Perfectionism, Shyness, Burnout, Overwhelm)

Requirements:

Keep lists simple (no definitions per item)

Add a short bridging sentence explaining that these categories are often discussed differently depending on context

Ensure it is clear these are examples, not a complete or final classification system

🌱 SECTION 2: "Why It Matters / Impact of Stigma" (REFINE)

Rewrite this section to align with the broader theme of perception and interpretation of behavior.

Remove structured labels or report-style formatting.

Instead, express ideas through reflective, everyday-life framing such as:

people being misunderstood based on surface behavior

hesitation to speak up or seek help due to fear of being misinterpreted

small misunderstandings building into isolation or shame

differences in how people experience attention, emotion, and stress being overlooked

awareness helping people create more understanding environments

Tone must remain observational and reflective, not instructional or policy-like.

🎯 FINAL GOAL:

The entire website should now communicate a unified idea:

People are often more complex than their surface behavior suggests, and understanding improves when we look beyond first impressions and familiar labels.

The reader should feel:

"I've misinterpreted things like this before"

"There's more going on than I assumed"

"Understanding people takes a bit more context than first impressions"

Third Output

As usual, I only show which sections have changed.

[Beyond the Surface](#)[Understanding the Range](#)[Situations You Might Recognize](#)[Why It Matters](#)[Small Shifts in Understanding](#)

BEYOND SURFACE IMPRESSIONS

More Than Meets the Eye

People are often more complex than their behavior suggests.
Understanding begins when we look a little deeper.

[Learn More](#)

Made with Replit

CanvasNeurodivergence...@replit.dev /#understanding

[Beyond the Surface](#)[Understanding the Range](#)[Situations You Might Recognize](#)[Why It Matters](#)[Small Shifts in Understanding](#)

A STARTING POINT

Understanding the Range

When we talk about how people think, feel, and experience the world, it helps to understand that there's a wide range of conditions, traits, and experiences involved — and they're often discussed very differently depending on the context. These are just some examples. They are not a complete or final classification.

Neurodivergence

Natural differences in how the brain processes information, attention, and learning.

ADHDAutismDyslexia

DyspraxiaDyscalculia

Tourette Syndrome

Related Mental Health Conditions

Conditions that affect mood, thought patterns, and emotional regulation — often misunderstood in everyday contexts.

OCDAnxiety disordersDepression

PTSD

Commonly Confused Everyday Traits

Experiences often mistaken for personality flaws, but which can signal something deeper worth understanding.

IntroversiPerfectionismShyness

BurnoutOverwhelm

These categories are used here as examples. In practice, they often overlap, and the same person may relate to more than one area at different times or in different ways.

Made with Replit

THE BIGGER PICTURE

Why It Matters

When people are seen only through the lens of their surface behavior, something important gets missed — and over time, that gap can have real consequences.

Think about someone who seems withdrawn or distracted in a meeting — not because they don't care, but because they're processing information differently, or quietly managing something others can't see. When we jump to conclusions about behavior, we often miss what's actually going on.

Being misread repeatedly — at school, at work, in social situations — can make a person feel like the problem is entirely their own. That feeling builds quietly. It doesn't always show up right away.

You might have noticed how hard it can be to speak up when you're not sure how you'll be understood. For many people, the hesitation isn't about the situation itself — it's about how they've been interpreted in similar situations before. That hesitation can become a habit of staying quiet, even when help is available.

Small misunderstandings, repeated often enough, can lead to isolation — not because people are excluded outright, but because they stop expecting to be understood.

When awareness grows — when people around us are a little more curious, a little slower to judge — everyday environments become more open. Not perfectly, and not all at once. But in small, real ways, understanding creates the kind of space where people feel seen rather than managed, and supported rather than corrected.

Third Evaluation

The content is coming together, but it's so far been mostly reflective. Now I want a clearer direction for readers. I think a "Conclusion" section would work well here.

Technically I don't need to do this, and maybe what was expected of me was to iterate on the design of the page itself, but eh, iterating on content is more fun for me.

Fourth Prompt

Add or replace the final section of the website with a strong concluding "closing reflection" section that ties the entire page together.

This section should feel like the natural end of a reflective article and should leave the reader with a simple, memorable way of thinking about people.

 Purpose of this section:

The goal is to summarize the entire page into one clear idea:

people are often more complex than their surface behavior
first impressions are incomplete
understanding improves when we pause before labeling or assuming

This is not a lecture or instruction list — it should feel like a gentle final reflection.

 Tone requirements:

simple, conversational language
reflective and calm
not preachy or moralizing
consistent with "you might notice / in everyday moments" tone used throughout the site

 Content direction:

The section should:

briefly compress the main message of the page
avoid introducing new ideas or categories
reinforce that behavior is not the full story of a person
encourage curiosity and slowing down interpretation

Include ideas such as:

first impressions can be incomplete
behavior is only one part of a wider internal experience
labels are shortcuts, not full explanations
pausing before judgment can change how we understand others

 Required ending structure:

The section should end with a reflective question as the final line.

Use one of the following (or a very similar variation):

“What will you do next time someone’s behavior doesn’t immediately make sense to you?”
OR a closely related variation that keeps the same meaning

The question should feel open-ended, personal, and reflective — not instructional.

 Final goal:

The reader should leave with:

a calm sense of reflection
a simple mental rule of thumb about interpretation
an open question that encourages real-life application

The ending should feel like a natural pause, not a conclusion statement.

Fourth Output

The screenshot shows a Replit canvas with a document titled "Beyond the Surface". The document has a navigation bar with links: "Beyond the Surface", "Understanding the Range", "Situations You Might Recognize", "Why It Matters", and "Small Shifts in Understanding". The main content is a section titled "A FINAL THOUGHT" which contains three paragraphs of text. The first paragraph discusses how we often reach for a nearest explanation (distracted, difficult, lazy, dramatic) as a natural shortcut, and how labels help us make sense of what we're seeing quickly. The second paragraph explains that a label is rarely the full story, and that behind most behavior is a wider internal experience (attention, emotion, stress, and perception) that isn't always visible and isn't always easy to explain. The third paragraph states that you don't need to have all the answers or understand everything about someone to respond to them with a little more curiosity, and that sometimes the most useful thing is just a small pause — a moment before the label, before the assumption, before the conclusion. The section ends with a reflective question: "What will you do next time someone's behavior doesn't immediately make sense to you?". The footer of the canvas includes the text "More Than Meets the Eye" and "Understanding people more deeply, one conversation at a time.", along with a "Made with Replit" button.

Canvas Neurodivergence... < .replit.dev /#what-you-can-do

Beyond the Surface Understanding the Range Situations You Might Recognize Why It Matters Small Shifts in Understanding

A FINAL THOUGHT

Most of the time, when someone's behavior doesn't make sense to us, we reach for the nearest explanation — distracted, difficult, lazy, dramatic. It's a natural shortcut. Labels help us make sense of what we're seeing quickly.

But a label is rarely the full story. Behind most behavior is a wider internal experience — one that isn't always visible, and isn't always easy to explain. Attention, emotion, stress, and perception all work differently in different people, and what looks like one thing from the outside can feel like something else entirely from the inside.

You don't need to have all the answers. You don't need to understand everything about someone to respond to them with a little more curiosity. Sometimes the most useful thing is just a small pause — a moment before the label, before the assumption, before the conclusion.

What will you do next time someone's behavior doesn't immediately make sense to you?

More Than Meets the Eye
Understanding people more deeply, one conversation at a time.

Made with Replit

Fourth Evaluation, Iteration

Looks good, basically almost done. Let's do some final iterations. I won't mention everything, but just know I changed a bunch of styling, some wording, asked it to add nav for the conclusion, and prompted a bunch to change some hover animations for more contrast and whatnot.

Final Output

<https://beyond-the-surface--rmolero1.replit.app/>

As usual, here is what changed.
Conclusion and nav bar:

Subtle hover effect:

Final Reflection

The AI gave me more time to work with than I had expected. With Figma I only had about 3 prompts to work with, while Replit let me do four major changes and a few more minor edits, and I still haven't hit the limit. I guess the Figma project I made in Laboratory 5 was more complicated, having way more moving parts, while this website is mostly just a simple web page. Still, more than expected.

It made a decent looking website. Of course, it's nothing too outstanding. In fact it was designed to be similar to many other sites. It works as a nice prototype, but there are still many more considerations to make if I were an actual UI/UX developer. Some text boxes could be replaced with simple paragraphs, the layout could have left/right borders, maybe there should be images or contact details or something that shows the readers where they could learn more or maybe information about some organization that would be pushing this advocacy like many non-profit organizations. There is a lot of consideration that goes into a website, and a lot more care needed with how a message as important as "mental health awareness" should be conveyed.

If you want "something that works", an AI can definitely do it for you. It lets me prototype many different variations of the same website, judge its impact, and most importantly scrap and rebuild things quickly without spending too much time. It gets me 80% of the way very, very quickly. But if I want something that's accurate to my intent, there's no getting around it. I have to actually think carefully and design it with artistic intent, from the content to the presentation to the color scheme and everything in between. For that I'd probably need a real UI/UX design laid out before actually implementing it. Some things are easier to design with a visual editor than using words to micromanage an AI to design visuals. And any text generated should only ever be a guide. I want to have the final say in everything, and that includes the wording. It should be text by humans for humans.

Welp, looks like I've prompted enough that my writing style itself has changed. I've started to write a bit more like ChatGPT. Not that that's exactly a bad thing. Makes it harder for teachers to tell whether I wrote it myself or not.

For once, this isn't 300 words, so you get 418.
